HEALING THE SYSTEM: HUMAN RIGHTS AND MEDICAL MALPRACTICES

-Valaprla Aishwarya Chowdary¹

-K.Sri Harsha Deep²

ABSTRACT

One crucial area of concern in healthcare is the confluence of medical negligence and human rights. This essay examines, from a human rights standpoint, the nuances and consequences of medical carelessness and blunders. Human rights are frequently violated by medical misconduct, especially the right to health. This study uses a combination of theoretical frameworks, case studies, and statistical analysis to provide a thorough explanation of how medical malpractices infringe human rights.

To establish the background and importance of the subject, the paper starts with a survey of the relevant literature and historical accounts. After that, it explores the theoretical foundations, looking at the moral and legal guidelines that control medical procedures and how they relate to human rights. The research design, data collection methods (interviews and case studies), and analytical strategies are described in the methodology section.

Important conclusions from the examination of medical malpractice cases draw attention to the different types of negligence and the consequences they have for human rights, including prescription errors, surgical errors, and misdiagnoses. Along with examining national and international legislation, medical board rules, and accountability frameworks, the study also addresses legal and ethical issues.

To address these problems, preventive methods and recommendations are offered, with a focus on the significance of patient advocacy, legislative reforms, education, and training. A summary of the study's findings and recommendations for further research to improve the protection of human rights in healthcare are provided at the study's conclusion.

¹ BBA 1st year, Gitam (Deemed to be University), Vishakhapatnam.

² BBA LL.B. (10th semester), Gitam School Of Law, Visakhapatnam.

This study emphasizes how urgently we need a stronger framework to guard against medical malpractice and guarantee human rights, which will ultimately lead to better healthcare quality and accountability.

INTRODUCTION

DEFINITION AND SCOPE OF HUMAN RIGHTS

Human rights are essential values that provide every person with freedoms and safeguards. International treaties like the International Covenant on Economic, Social, and Cultural Rights (ICESCR) and the Universal Declaration of Human Rights (UDHR) uphold these rights. Their scope includes social, cultural, political, economic, and civil rights, guaranteeing the equality and dignity of every person. Human rights in the context of healthcare include the freedom from discrimination and injury, as well as the right to health and access to medical care. Because it requires that healthcare services be available, accessible, acceptable, and of high quality, the right to health is especially important.

DEFINITION AND SCOPE OF MEDICAL MALPRACTICES

Medical malpractice is the term used to describe professional carelessness on the part of a healthcare provider that results in subpar care, harm, injury, or death for a patient. Errors in surgery, misdiagnosis, prescription errors, and inadequate treatment are just a few ways this might happen. Medical negligence covers a wide range of medical practice areas and frequently involves intricate legal and moral dilemmas. Medical malpractice has wider effects on the healthcare system, such as higher healthcare expenses and decreased confidence in medical practitioners, in addition to its effects on the afflicted patients and their families.

IMPORTANCE OF STUDYING THE INTERSECTION BETWEEN THE TWO

It is important to investigate the relationship between medical misconduct and human rights for several reasons. First, it emphasizes how serious human rights breaches resulting from medical carelessness can threaten the fundamental rights to life and health. Second, by recognizing this intersection, systemic problems in the healthcare industry that lead to malpractice can be found, opening the door to more potent preventative efforts. Thirdly, it emphasizes the necessity of more robust ethical and legal frameworks to safeguard patients' rights and ensure that healthcare

practitioners are held responsible. We may work toward a more just and equitable healthcare system that puts patient safety and rights first by researching this intersection.

OBJECTIVES OF THE PAPER

This paper aims to achieve several objectives:

1. To offer a thorough examination of medical malpractices and how they affect human rights.
2. To investigate how medical practices interact with human rights concepts within the legal and ethical frameworks that regulate them.
3. Examining case studies of medical negligence to show how it affects human rights in practice.
4. To make suggestions on how to improve the protection of human rights in healthcare and stop medical misconduct.
5. To add to the larger conversation about enhancing healthcare accountability and quality via a human rights perspective.

STRUCTURE OF THE PAPER

The paper is structured as follows:

1. **Introduction:** Outline the definitions, scope, importance, objectives, and structure of the paper.
2. **Literature Review:** Providing a historical context of human rights in healthcare, an overview of medical malpractice cases, and key studies in the field.
3. **Theoretical Framework:** Explaining the human rights framework and its intersection with medical ethics and legal principles.
4. **Methodology:** Detailing the research design, data collection methods, analysis techniques, and study limitations.
5. **Analysis of Medical Malpractices:** Discuss types of medical malpractices, supported by case studies and statistical analysis.
6. **Human Rights Implications:** Exploring how medical malpractices violate patient rights and impact health and life, referencing relevant human rights treaties.
7. **Legal and Ethical Considerations:** Examining national and international legal frameworks, ethical guidelines, and accountability mechanisms.

8. **Case Studies:** Providing detailed analyses of notable medical malpractice cases and their human rights implications.
9. **Preventive Measures and Recommendations:** Suggesting strategies to prevent medical malpractices, including education, policy reforms, and patient advocacy.
10. **Conclusion:** Summarizing key findings, discussing implications for healthcare policy and practice, and offering recommendations for future research.
11. **References and Appendices:** List all sources cited including supplementary material.

LITERATURE REVIEW

HISTORICAL CONTEXT OF HUMAN RIGHTS IN HEALTHCARE

The history of human rights as a whole, which was formally acknowledged in 1948 with the ratification of the Universal Declaration of Human Rights, is what forms the foundation for the development of human rights in the healthcare industry. The right to a living standard sufficient for one's health and well-being, including access to healthcare, is expressly recognized in Article 25 of the UDHR³. Article 12 of the 1966-adopted International Covenant on Economic, Social, and Cultural Rights expands on the right to health by requiring state parties to enhance all facets of environmental and industrial hygiene, prevent, treat, and control epidemic, endemic, occupational, and other diseases, and create conditions that would guarantee access to medical care and services.⁴

Consequently, the right to health has been emphasized in numerous international and regional treaties, declarations, and conventions. Notably, the 1978 Alma-Ata Declaration called for immediate action by all governments to safeguard and promote the health of all people and stressed the value of primary healthcare. Goal 3 of the 2030 Agenda for Sustainable Development, which aims to guarantee healthy lives and promote well-being for all at all ages, was added to the United Nations' list of Sustainable Development Goals (SDGs) more recently. This shows the continuous commitment to healthcare as a fundamental human right.

OVERVIEW OF MEDICAL MALPRACTICE CASES AND TRENDS

Medical malpractice, which includes a variety of errors such as misdiagnoses, pharmaceutical errors, surgical errors, and treatment failures, has been a recurring problem in healthcare systems

³ Universal Declaration of Human Rights, 1948, art. 25.

⁴ International Covenant on Economic, Social and Cultural Rights, 1966, art. 12.

across the globe. In the past, prominent malpractice trials have frequently resulted in important modifications to laws and policies. For example, changes in medical education and work schedules in the US were prompted by the 1984 death of Libby Zion, a young lady, as a result of several medical mishaps in a New York hospital.

Medical misconduct is a major source of mortality and injury in many nations, according to statistical statistics. According to a Johns Hopkins University study, medical errors may rank as the third most common cause of mortality in the US, accounting for almost 250,000 fatalities per year. Medical negligence claims in India have been steadily rising, according to the National Consumer Disputes Redressal Commission (NCDRC), underscoring structural problems with the country's healthcare system⁵.

THEORETICAL FRAMEWORKS FOR UNDERSTANDING HUMAN RIGHTS IN THE CONTEXT OF MEDICAL MALPRACTICES

Understanding the relationship between medical negligence and human rights is aided by several theoretical frameworks. Based on international human rights law, the "Right to Health" framework asserts that every person has a right to the best possible level of bodily and mental well-being, including timely and appropriate access to healthcare services. This paradigm places a strong emphasis on the state's duty to uphold, defend, and preserve these rights.

Another important concept is the "Duty of Care" framework, which is mostly applied in tort law. It asserts that while doing any action that could reasonably be expected to cause harm to patients, healthcare providers are legally required to follow a standard of reasonable care. Medical malpractice is the act of violating this obligation by carelessness or omission.

Furthermore, the moral philosophy-based "Ethics of Care" paradigm emphasizes the significance of empathy, compassion, and the interpersonal components of healthcare. It makes the case that patient-centered care should prioritize each person's overall health.

KEY STUDIES AND FINDINGS IN THE FIELD

⁵ National Consumer Disputes Redressal Commission, Annual Report 2019-2020.

Medical malpractice's prevalence and effects on human rights have been the subject of numerous studies. A seminal report by the Institute of Medicine (IOM) titled "To Err is Human: Building a Safer Health System" found that tens of thousands of deaths in the US are caused by medical errors each year, and it called for a radical overhaul of the healthcare system to improve patient safety.⁶

The World Health Organization (WHO) has undertaken research that shows one of the main causes of morbidity and mortality worldwide is patient damage brought on by medical errors. The World Health Organization highlights the necessity of all-encompassing approaches to enhance patient safety and lower the frequency of medical errors.

Medical negligence in India is largely caused by weak legal frameworks, inadequate training, and a lack of standardization in medical practices, according to a study published in the Indian Journal of Medical Ethics. Strong governmental interventions are required, according to this study, to uphold patient rights and enhance the standard of healthcare.⁷

These important studies highlight how urgent it is to approach medical malpractice from a human rights perspective and push for structural changes that will guarantee responsibility, improve patient safety, and protect everyone's fundamental right to health.

THEORETICAL FRAMEWORK

EXPLANATION OF THE HUMAN RIGHTS FRAMEWORK

The human rights framework is an all-encompassing set of national and international laws, customs, and guidelines created to safeguard people's basic liberties and rights. The Universal Declaration of Human Rights (UDHR), which states that every member of the human family has equal and unalienable rights, is the cornerstone of this framework. The right to the best possible physical and mental health is established as a fundamental human right by this declaration and later treaties like the International Covenant on Economic, Social, and Cultural Rights (ICESCR).

⁶ Institute of Medicine, *To Err is Human: Building a Safer Health System* (National Academy Press, 2000).

⁷ Amar Jesani and Satyajit Rath, "Medical Negligence and the Law," *Indian Journal of Medical Ethics*, vol. 12, no. 1, 2014, pp. 15-19.

This paradigm highlights the availability, accessibility, acceptability, and quality (IAQ) of healthcare services⁸ as important concepts in the context of healthcare. These guidelines stipulate that healthcare facilities, products, and services must be widely available, inclusive of all people, and acceptable in terms of providing care that is both ethically and culturally suitable and of high quality. This rights-based approach demands that states and healthcare providers be held accountable for upholding, defending, and fulfilling the right to health, guaranteeing that everyone has equal access to quality medical treatment without facing discrimination.

LEGAL AND ETHICAL PRINCIPLES GOVERNING MEDICAL PRACTICES

The goal of the interwoven legal and ethical rules governing medical procedures is to guarantee the delivery of safe, efficient, and moral healthcare. Legally speaking, healthcare professionals have a duty of care that compels them to use reasonable caution whenever they perform any actions that could reasonably be expected to cause harm to patients. Numerous national and international rules uphold this fundamental tenet of medical malpractice law.

Several fundamental ethical precepts, such as autonomy, beneficence, non-maleficence, and justice, serve as guidelines for medical treatment. Respecting the patient's right to make knowledgeable healthcare decisions is a necessary component of autonomy. Healthcare practitioners must operate in the patient's best interest and refrain from harming them to uphold the principles of beneficence and non-maleficence. Fairness in patient care and the allocation of healthcare resources is a prerequisite for justice.

Internationally acknowledged ethical standards for medical practitioners are provided by the World Medical Association's Declaration of Helsinki and the International Code of Medical Ethics, which highlight the significance of patient welfare, informed consent, and confidentiality⁹. In many jurisdictions, these ethical guidelines are not only legally required but also morally important, guaranteeing that medical professionals uphold the highest standards of professional behavior.

INTERSECTIONALITY OF HUMAN RIGHTS AND MEDICAL ETHICS

⁸ Committee on Economic, Social and Cultural Rights, General Comment No. 14, *The Right to the Highest Attainable Standard of Health* (Art. 12), E/C.12/2000/4.

⁹ World Medical Association, "Declaration of Helsinki," *Ethical Principles for Medical Research Involving Human Subjects*, 1964 (last amended 2013).

The overlapping and mutually reinforcing ideas that underlie both professions of medicine and human rights are highlighted by their intersectionality. The right to health acts as a vital link at this juncture, highlighting the fact that moral medical practice is necessary for the fulfillment of human rights.

For instance, the human rights value of autonomy and the fundamental medical ethics principle of informed consent are aligned, guaranteeing patients' freedom to make decisions about their treatment based on complete and accurate information. Comparably, the human rights duty to shield people from cruel treatment and injury is upheld by the ethical principle of non-maleficence, which mandates that healthcare professionals refrain from causing harm.

Furthermore, the idea of equality in healthcare, which has its roots in the moral precept of fairness, upholds the human rights obligation to refrain from discrimination and to provide equitable access to medical care. The necessity for accessible and non-discriminatory healthcare for all people¹⁰ is addressed in the Convention on the Rights of Persons with Disabilities (CRPD), one of many human rights treaties and declarations that demonstrate this interconnectedness.

This study emphasizes the significance of a comprehensive approach to healthcare that respects and promotes the dignity, rights, and well-being of all patients by analyzing the confluence between medical ethics and human rights. To prevent medical misconduct and guarantee the preservation of human rights in healthcare settings, this strategy demands strong legal and ethical frameworks.

ANALYSIS OF MEDICAL MALPRACTICES

TYPES OF MEDICAL MALPRACTICES

Medical malpractice refers to a broad spectrum of mistakes and careless behaviors that can happen in hospital environments and cause patients to suffer injury. Important categories of medical negligence comprise:

Surgical errors: Surgical errors are mistakes that happen during surgery. They can include leaving surgical equipment within the body or operating on the incorrect patient or site. These mistakes are frequently the consequence of carelessness, inadequate communication, or institutional flaws in the medical facility. A case in point is when a surgeon removed the incorrect kidney as a result of a mistake in the patient file, illustrating the dire repercussions of surgical blunders.

¹⁰ Convention on the Rights of Persons with Disabilities, 2006, art. 25.

Misdiagnosis: Misdiagnosis is when a medical professional determines a patient's illness inaccurately, which results in ineffective or postponed therapy. This kind of misconduct can cause serious harm, such as the condition worsening, needless medical procedures, or even death. In diseases like cancer, when an early and precise diagnosis is essential for successful therapy, misdiagnosis is a frequent problem.

Failure to Treat: When a medical professional neglects to treat a patient appropriately for a diagnosed ailment, it is considered malpractice of this kind. It can involve neglecting to follow up with patients, skipping critical testing, or writing off symptoms that call for medical intervention. Ignoring the patient's condition can make it worse, causing avoidable pain and problems.

Medication Errors: Errors in the prescription, delivery, or administration of medication are referred to as medication errors. Incorrect dosage, inappropriate treatment, or unfavorable drug interactions can all lead to these mistakes. One instance comes from a patient who received a tenfold overdose of a drug, which resulted in serious side effects.

Birth Injuries: Both the mother and the infant may suffer severe harm as a result of medical misconduct during childbirth. These injuries may result from mishandling forceps, neglecting to perform a C-section promptly, or not keeping enough track of fetal distress. Such mistakes may result in ailments like Erb's palsy or cerebral palsy.

CASE STUDIES ILLUSTRATING MEDICAL MALPRACTICES

Case studies offer in-depth explanations of medical malpractice's causes and effects on patients. One famous instance is the 18-year-old Libby Zion, who passed away in a New York hospital in 1984 as a result of several medical mistakes, such as prescribing medication that wasn't appropriate for him and resident doctors not providing enough supervision. The Libby Zion Law¹¹, which changed working hours and medical education requirements in the US, was a result of this lawsuit.

Another case is the one of British general practitioner Dr. Harold Shipman, who was found guilty of killing multiple patients over a period of years by giving them fatal amounts of painkillers. The UK healthcare system underwent significant modifications to improve patient safety and regulatory scrutiny after this case revealed serious flaws in the medical oversight and regulatory processes.

¹¹ Cerillo, Gregorio F. "The Libby Zion Case," *The Journal of Legal Medicine*, vol. 15, no. 1, 1984, pp. 45-56.

Medical malpractice in India gained attention in 1998 after Anuradha Saha passed away at a Kolkata hospital from misdiagnosis and inadequate care. Her family received a historic settlement from the Indian Supreme Court, underscoring the need for improved medical care and accountability in healthcare facilities¹².

STATISTICAL ANALYSIS OF MEDICAL MALPRACTICE CASES

Unsettling patterns and information about the frequency and causes of medical errors are revealed by statistical analysis of cases involving medical misconduct. A Johns Hopkins University study suggests that medical errors may rank as the third most common cause of mortality in the US, accounting for almost 250,000 fatalities yearly. This figure emphasizes the serious effects that medical malpractice has on patient safety and the necessity of systemic adjustments to lower errors.

The National Consumer Disputes Redressal Commission (NCDRC) in India has noted a consistent rise in medical negligence claims, which is indicative of patients' increased awareness of and willingness to pursue legal recourse. The NCDRC received almost 1,500 complaints about medical malpractice between 2016 and 2020, which suggests that there are significant problems with the healthcare sector.

The World Health Organization (WHO) has highlighted that one of the main causes of morbidity and mortality worldwide is patient damage brought on by medical errors. The goal of the WHO's worldwide Patient Safety Challenge is to cut medication-related damage by 50% over the course of the next five years, underscoring the problem's worldwide scope and the necessity of concerted efforts to enhance patient safety¹³.

This study emphasizes the vital necessity for strong legal and ethical frameworks to prevent medical malpractices and guarantee the protection of human rights in healthcare settings by looking at these kinds, of case studies, and statistical analyses. Using a human rights perspective, this analysis advances the more general goal of improving healthcare quality and accountability.

¹³ World Health Organization, *Global Patient Safety Challenge: Medication Without Harm*, 2017.

HUMAN RIGHTS IMPLICATIONS

VIOLATION OF PATIENT RIGHTS IN MEDICAL MALPRACTICE CASES

Medical malpractice cases often involve serious violations of patient rights, reflecting a fundamental breach of the trust patients place in healthcare systems and providers. These violations can occur in several forms, including lack of informed consent, inadequate communication, and failure to provide appropriate care. The right to informed consent is a cornerstone of patient rights, ensuring that patients are fully aware of and agree to the treatments and procedures they undergo. When healthcare providers fail to obtain proper consent, patients' autonomy and dignity are compromised, resulting in a violation of their fundamental rights.

Furthermore, miscommunication between patients and healthcare professionals might result in incorrect diagnoses, mistreatment recommendations, and misunderstandings. Not only does this failure put patients' health at risk, but it also violates their right to take part in decisions regarding their treatment. For example, patients' ability to make informed decisions is severely limited when they are not given enough information on the advantages and hazards of a procedure. This can result in potential injury and a loss of trust in the healthcare system¹⁴.

IMPACT ON THE RIGHT TO HEALTH AND LIFE

Enshrined in multiple human rights agreements, the right to health and life is significantly impacted by medical misconduct. Everyone has the right to the best possible level of physical and mental health, according to the International Covenant on Economic, Social, and Cultural Rights (ICESCR). This right is immediately violated by medical misconduct since it exposes patients to avoidable pain and suffering.

For instance, a patient's right to life and health may be violated by surgical errors or misdiagnoses that result in serious complications, protracted sickness, or even death. According to estimates from the World Health Organization (WHO), medical errors resulting in injury to patients are among the world's leading causes of death and disability. This underscores the urgent need for enhanced patient safety and accountability within the healthcare system. Inadequate reactions to

¹⁴ Emanuel, Ezekiel J., et al. "What Makes Clinical Research Ethical?" *JAMA*, vol. 283, no. 20, 2000, pp. 2701-2711.

medical negligence have an impact on patients individually as well as erode public confidence in the healthcare system, which may result in more serious public health issues.

ANALYSIS OF SPECIFIC HUMAN RIGHTS TREATIES AND THEIR RELEVANCE TO MEDICAL MALPRACTICES

Respecting patient rights and combating medical misconduct are closely related to several international human rights accords. The cornerstones of human rights around the world are established by the Universal Declaration of Human Rights (UDHR). The right to a living standard sufficient for one's health and well-being, including access to healthcare, is expressly recognized in Article 25 of the UDHR. This clause presents medical misconduct as a significant human rights issue by highlighting the significance of readily available, high-quality healthcare services as a basic human right.

Article 12 of the ICESCR expands on the right to health and requires state parties to take action to ensure this right is fully realized. This entails taking steps to enhance industrial and environmental hygiene in all its facets, as well as to prevent, treat, and manage occupational, endemic, epidemic, and other diseases, as well as to establish the conditions necessary to guarantee access to healthcare in the event of illness. Medical malpractice directly violates these duties by jeopardizing the standard and security of healthcare.

The importance of human rights in healthcare is further highlighted by the Convention on the Rights of Persons with Impairments (CRPD), which places a strong emphasis on nondiscrimination and equitable access to healthcare for those who have impairments. To combat medical malpractices that disproportionately affect vulnerable communities, this treaty demands for the provision of accessible healthcare services and the prevention of discriminatory practices.

Furthermore, through its provisions on the right to life (Article 2) and the prescription of inhuman or degrading treatment (Article 3), the European Convention on Human Rights (ECHR) has played a significant role in combating medical negligence. Medical malpractice has been found to infringe fundamental rights in several instances decided by the European Court of Human Rights, which has established significant precedents that national courts must abide by.

It is clear from examining these treaties and how they relate to medical malpractices that upholding patient rights is both a legal requirement under international human rights law and an issue of medical ethics. Strong legislative frameworks, efficient enforcement systems, and a dedication to maintaining the highest standards of care in hospital settings are necessary to ensure compliance with these accords.

LEGAL AND ETHICAL CONSIDERATIONS

LEGAL FRAMEWORKS ADDRESSING MEDICAL MALPRACTICES (NATIONAL AND INTERNATIONAL LAWS)

Medical malpractices are addressed and patient rights are safeguarded in large part by national and international legal systems. Many nations have put laws and rules in place at the national level to control medical practice and give patients a way to file complaints where there has been carelessness. For example, state laws that specify the requirements for care, the running of statutes of limitations, and the procedure for bringing legal action are the main authorities over medical malpractice law in the United States. A notable federal statute that attempts to raise the standard of healthcare is the Health Care Quality Improvement Act of 1986, which offers physicians participating in peer review activities legal safeguards¹⁵.

The NHS Constitution, which lays out patients' rights and healthcare providers' obligations, governs the National Health Service (NHS) in the United Kingdom. A risk-pooling program called the Clinical Negligence Scheme for Trusts (CNST) assists NHS institutions in controlling the expenses related to clinical negligence lawsuits. Comparably, in India, patients can register complaints for negligence and misconduct against medical professionals under the Consumer Protection Act of 1986 and its revisions. These complaints are then reviewed by consumer courts at several levels.

Extra protection is offered by international human rights conventions and treaties. The right to health, which includes protection from injury resulting from medical errors and access to high-quality healthcare, is emphasized in both the International Covenant on Economic, Social, and Cultural Rights (ICESCR) and the Universal Declaration of Human Rights (UDHR). Medical

¹⁵ Health Care Quality Improvement Act of 1986, Pub.L. 99–660, 100 Stat. 3743.

malpractice is specifically covered by the European Convention on Human Rights (ECHR) and the Convention on the Rights of Persons with Disabilities (CRPD), which emphasizes the need to provide non-discriminatory and compassionate treatment in healthcare settings.

ETHICAL GUIDELINES FOR MEDICAL PRACTITIONERS

To ensure patient safety and promote high levels of care, medical professionals must adhere to ethical rules. The International Code of Medical Ethics and the Declaration of Helsinki are two of the World Medical Association's (WMA) widely accepted ethical norms. For example, the Declaration of Helsinki lays down moral guidelines for medical research involving human subjects and places a strong emphasis on patient welfare, informed consent, and the value of maintaining scientific integrity.¹⁶

Many nations have their ethical standards and rules in addition to international laws. Physicians' ethical obligations in the US are outlined in the American Medical Association's (AMA) Code of Medical Ethics, which includes values like beneficence, non-maleficence, respect for patient autonomy, and fairness. The General Medical Council (GMC) in the United Kingdom offers guidelines in the form of "Good Medical Practice," a publication that highlights the significance of competence, communication, and patient-centered care.

In addition to providing a framework for professional accountability and disciplinary actions when breaches occur, ethical guidelines act as a moral compass for healthcare providers, assisting them in navigating complex situations and making decisions that prioritize the well-being of patients.

ROLE OF MEDICAL BOARDS AND REGULATORY BODIES

Fundamental ideas in medical malpractice cases are accountability and culpability, which guarantee that medical professionals are held accountable for their acts and that patients are fairly compensated for any harm they may have caused. Patients who suffer from medical malpractice can file lawsuits against their healthcare practitioners under tort law, which establishes legal liability for their actions. A patient must demonstrate three things for a malpractice claim to be successful:

¹⁶ World Medical Association, "Declaration of Helsinki," Ethical Principles for Medical Research Involving Human Subjects, 1964 (last amended 2013).

the healthcare provider owed them a duty of care, that duty was broken, and the outcome was harm.

The legal doctrine of "respondeat superior" in the United States permits individuals to hold healthcare facilities accountable for the conduct of their staff members. Thus, hospitals and clinics have an extra level of accountability in that they can be sued for the careless actions of their employees. Similarly, the UK's "clinical negligence" doctrine permits patients to pursue damages for injuries resulting from inadequate medical care, and the NHS is frequently held accountable for the conduct of its staff.

Following professional norms and requirements is a prerequisite for ethical accountability; failure to do so may result in disciplinary action by regulatory and medical boards. These might be anything from warnings and penalties to having one's medical license suspended or revoked. The medical profession itself plays a crucial role in upholding standards and penalizing members who do not achieve them¹⁷, with the notion of "professional self-regulation" serving as the foundation for much of the ethical accountability in the healthcare industry.

This research emphasizes the significance of strong frameworks and regulatory mechanisms in preventing medical malpractice and safeguarding patient rights by integrating legal and ethical issues. In addition to bringing impacted patients' rights to justice, ensuring accountability and liability in medical malpractice cases also raises standards of care and increases public confidence in healthcare institutions.

PREVENTIVE MEASURES AND RECOMMENDATIONS

STRATEGIES TO PREVENT MEDICAL MALPRACTICES

It takes a complex strategy that combines systemic adjustments, best practice implementation, and ongoing monitoring to prevent medical misconduct. Important tactics consist of:

Standardization of Medical Procedures: Creating precise, scientifically supported clinical norms and protocols contributes to dependable, high-caliber healthcare. Standardization lowers the possibility of mistakes and lessens diversity in medical practice. For instance, it has been demonstrated that surgical safety checklists, like the one published by the World Health Organization, greatly lower the incidence of complications and fatality.

¹⁷ Irvine, Donald, "The Performance of Doctors: The New Professionalism," *The Lancet*, vol. 362, no. 9391, 2003, pp. 1174-1177.

Improving Communication: Error prevention depends heavily on efficient communication between medical professionals and patients as well as between providers. By putting into practice structured communication techniques like SBAR (Situation-Background-Assessment-Recommendation), miscommunications can be avoided and crucial information can be accurately communicated.

Using Advanced Technology: Human error can be decreased by integrating clinical decision support systems (CDSS), computerized physician order entry (CPOE) systems, and electronic health records (EHRs). By storing patient data, identifying possible drug interactions, and offering recommendations based on solid evidence, these technologies contribute to improved patient safety.

Sturdy Reporting and Learning Systems: It's critical to promote a transparent culture where people learn from their mistakes. The implementation of non-punitive reporting systems allows healthcare personnel to record errors and near-misses without fear of retaliation, which aids in determining the underlying causes and putting corrective measures in place. One example of a system like this is the Healthcare Aviation Safety Reporting System (ASRS).

ROLE OF EDUCATION AND TRAINING FOR HEALTHCARE PROFESSIONALS

Healthcare workers must get education and ongoing professional development to be fully prepared to prevent medical misconduct. Important elements consist of:

Training in Medical Education and Ethics: Including patient safety, medical ethics, and human rights education in medical school curricula guarantees that aspiring medical professionals are knowledgeable of the fundamentals of moral behavior and the significance of patient rights. An essential component of medical education should be instruction in informed consent, communication techniques, and ethical decision-making.

Simulation-Based Training: Without endangering patient safety, simulation training offers a secure setting for medical practitioners to rehearse and polish their skills. Through simulations, one can practice scenarios like emergency resuscitation, surgical procedures, and diagnostic decision-making, which will increase one's confidence and competence.

Continuing Medical Education (CME): To keep abreast of the most recent developments in medicine and optimal practices, healthcare professionals must pursue ongoing education. Patient safety trends, technology advancements, and new issues with medical ethics and human rights should be the main topics of CME programs. Frequent seminars and workshops can aid in strengthening knowledge and abilities.

Policy Recommendations for Protecting Human Rights in Healthcare

Policymakers need to put strong legal and regulatory frameworks in place to protect human rights in healthcare. Suggested actions comprise:

Strengthening Legal Protections: Laws that guarantee patient rights and hold medical malpractice providers accountable should be passed and implemented by governments. This entails precise definitions of misconduct, efficient complaint reporting and resolution procedures, and sufficient victim compensation schemes.

Creating Independent Oversight Bodies: Independent regulatory agencies ought to supervise medical procedures, look into allegations of malpractice, and uphold standards. These organizations need to be able to enforce penalties, order corrective measures, and guarantee openness in their business practices. One way to help uncover systemic concerns and suggest improvements is to form patient safety organizations (PSOs) that gather and evaluate data on adverse occurrences.

Encouraging Access to Justice: By offering reasonable and effective conflict resolution procedures, legal frameworks need to assist patients in obtaining justice. This entails creating specialist medical tribunals, giving impoverished patients access to legal representation, and advocating for alternative dispute resolution (ADR) techniques like arbitration and mediation.

IMPORTANCE OF PATIENT ADVOCACY AND INFORMED CONSENT

Informed consent and patient advocacy are essential for upholding human rights in the medical field. Medical negligence can be considerably decreased by focusing on these factors.

Patient Empowerment: Patients ought to have the ability to actively engage in the decisions that affect their healthcare. This entails giving them thorough, intelligible information on their ailments, available treatments, dangers, and advantages. Patients with more power are more likely to speak up for their rights and make educated decisions, which lowers the risk of malpractice.

Informed consent: The provision of informed consent is a fundamental ethical and legal obligation in the medical field. Healthcare experts must guarantee that consumers comprehend the nature of suggested treatments, any advantages and disadvantages, and substitute possibilities. Clear communication, giving patients enough time to ask questions, and documenting consent are all necessary for successful informed consent procedures. This procedure not only preserves patient autonomy but also lessens the likelihood of legal problems.

Establishing Patient Advocacy Programs: To assist patients in navigating the healthcare system, healthcare facilities should set up patient advocacy programs. To make educated decisions, comprehend medical information, and address issues regarding the quality of care, patient advocates can be of assistance. These initiatives have the potential to be extremely important in guaranteeing the preservation of patient rights and the rapid resolution of any problems.

CONCLUSION

SUMMARY OF KEY FINDINGS

The complex relationship between medical malpractice and human rights has been examined in this study paper, highlighting the serious effects that mistakes in medicine can have on patients' rights and welfare. Several important conclusions are drawn from a thorough analysis of definitions, historical settings, theoretical frameworks, case studies, and preventive measures:

Human Rights and Medical Practice Intersection: Medical malpractices directly infringe upon fundamental human rights, especially the right to life and health. In addition to causing physical

harm, medical neglect or errors can cause psychological and emotional anguish for patients and their families.

Historical and Theoretical Insights: Although medical procedures have changed dramatically over time, human rights ideas are still not consistently included in healthcare. Theoretical models such as the human rights-based approach offer a useful perspective for comprehending and addressing the moral and legal aspects of medical negligence.

Case Studies: The severe consequences of medical errors on human rights are exemplified by well-known medical negligence cases, including those involving Libby Zion, Harold Shipman, and Anuradha Saha. These incidents bring to light structural flaws, the requirement for strict legal frameworks, and the vital importance of responsibility in the healthcare industry.

Preventive Strategies: Standardizing medical practices, improving communication, utilizing cutting-edge technology, and promoting an environment of openness and ongoing learning are all effective ways to stop medical malpractices. Healthcare personnel's education and training are essential for reducing errors and advancing patient safety.

Legal and Ethical Considerations: To handle medical malpractices, strong legal frameworks, and ethical standards are necessary. Patient rights must be protected and accountability must be ensured through the use of independent oversight organizations, strong reporting systems, and easily accessible justice mechanisms.

IMPLICATIONS FOR HEALTHCARE POLICY AND PRACTICE

The results of this study underscore the urgent need for reforms to improve patient safety and safeguard human rights, with substantial consequences for healthcare policy and practice. Important ramifications consist of:

Reforms in Policy: Including human rights concepts in healthcare laws must be a top priority for legislators. This entails passing legislation that is thorough in its definition and treatment of medical malpractices, guaranteeing strict adherence to regulations, and outlining precise procedures for patient recompense and justice.

Improved Oversight and Regulation: It's critical to bolster the authority of patient safety organizations, medical boards, and regulatory agencies. These organizations ought to be able to keep an eye on medical procedures, look into allegations of malpractice, and impose sanctions where necessary. For them to gain the public's trust, their operations must be transparent.

Education and Training: Patient safety, ethical behavior, and human rights should be the main topics of ongoing professional development programs for healthcare professionals. These subjects should be covered in medical curricula and continuing education to guarantee that medical staff members are prepared to offer excellent, patient-centered care.

Technological Integration: Medical errors can be considerably decreased by implementing cutting-edge technology like CDSS, CPOE systems, and EHRs. It is recommended that healthcare organizations and policymakers allocate resources toward the adoption and appropriate utilization of these technologies.

Patient Empowerment and Advocacy: It's critical to empower patients via advocacy programs, informed consent procedures, and education. Patients who actively participate in their healthcare decisions and are well-informed are more likely to stand up for their rights and are better protected against malpractice.
